

Problem 1: Many Time Pad

Let us see what goes wrong when a stream cipher key is used more than once. Below are eleven hex-encoded ciphertexts that are the result of encrypting eleven plaintexts with a stream cipher, all with the same stream cipher key. Your goal is to decrypt the last ciphertext, and submit the secret message within it as solution.

Hint: XOR the ciphertexts together, and consider what happens when a space is XORed with a character in [a-zA-Z].

Ciphertext #1:

```

```

Problem 2: AES Implementation

Write a python program to implement AES scheme. Follow the example given in your text book and use the same input. Your program should

- 1) Find the ciphertext for the given plaintext and key.
- 2) Show the avalanche effect for the change of ciphertext and key (use the same ciphertext and key used in your book).

For the time being, use the tables for S-box and IS-box for substitution bytes transformation and key expansion. (Later on we will come back to the calculation of S-Box, IS-Box and inverse multiplication in $GF(2^n)$).
